

MatchProcurement™

MatchProcurement is a MatchBack Systems solution for customers who seek strategic procurement to secure street-turn rates and ensure savings

The ideal time to lock in street-turn savings is during a procurement event. Yet without the visibility to match import supply with export locations, street-turn opportunities are hidden. Our solution not only identifies optimal container matches but provides support with bid preparation and analysis.

MatchProcurement delivers a systematic approach to transportation bids. Coupled with our other flagship services, it completes the street-turn lifecycle – identify, procure, execute and feedback.

HOW IT WORKS:

BID DESIGN

We analyze data from your network and optimize it against data from you and other customers on our platform.

Our match engine identifies optimal street-turns to guide your procurement plan. We provide metrics for bid events and include ROI analysis. Predetermine rates and pre-orchestrate street-turns to lock in savings.

EXECUTE AND MONITOR

You send us your daily feed which is optimized and automated in our system. We alert you when matches occur across your unique ecosystem. You execute street-turns with partners on our collaborative portal.

We provide analytic feedback through reports, scorecards and dashboards so you can monitor performance and savings throughout the street-turn lifecycle.

FREQUENTLY ASKED QUESTIONS:

Who executes the bid process?

MatchBack Systems presents the information for the bid through your bidding tool or you can use our procurement templates.

Do truckers in my network have to be MatchBack Systems customers?

No. We work with you to establish the procurement event to send to your partners.

How do I know where to sell and what to sell?

We identify the import and export tours, along with container size/type, that offer the most valuable street-turn opportunities for your network. This means you can determine the savings by lane in your transportation bid.

Our technology finds the hidden street-turn gems that ensure cost savings, while reducing empty distance and harmful emissions.
